## 1 Overview

**U-Boot Beton® Design Software** is the ideal tool for designing of voided slabs without drop panels or drop beams.

The voided slab with the U-Boot Beton® formwork is made up of a mutually orthogonal and interconnected rib pattern, integral with a continuous slab at the intrados and one at the extrados.

The structural behavior of a voided slab with U-Boot Beton® elements is the bidirectional one characteristic of the full-concrete slab, with the advantage of a substantial reduction in weight that allows savings both in concrete and steel reinforcement.

For this reason, U-Boot Beton® is the ideal solution for the realization of slab on large spans that can bear high overloads.

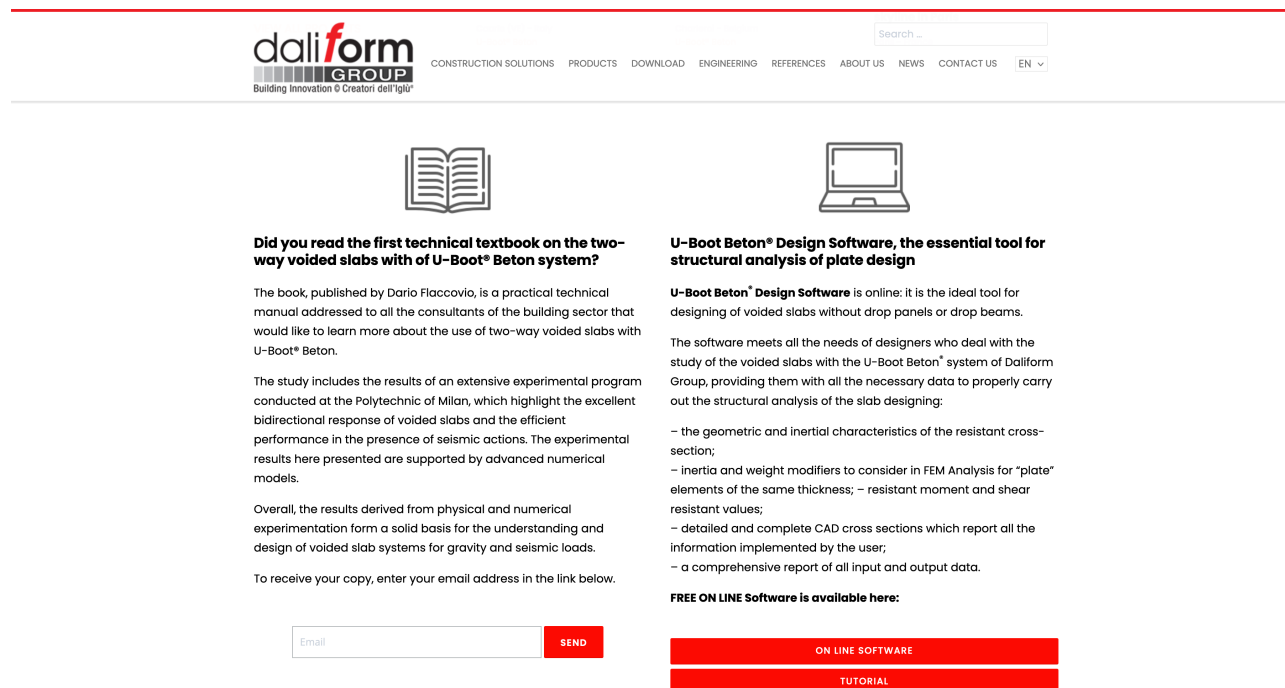

**U-Boot Design Software** meets all the needs of designers who deal with the study of the voided slabs with the U-Boot Beton® system of Daliform Group, providing them with all the necessary data to properly carry out the structural analysis of the slab designing.

In particular, the **U-Boot Design Software**, depending on the user-set floor configuration, provides:

- All the geometric and inertial characteristics of the resistant cross-section;
- Inertia and Weight Modifiers to consider in FEM Analysis for "Plate" elements of the same thickness;
- Resistant Moment and Shear resistant values;
- Detailed and complete CAD cross sections which report all the information implemented by the user;
- A comprehensive Report of all Input and Output data.

All of the above information represents a valuable support to the designer and can be used to implement numerical analysis conducted with the help of the most commonly used structural calculation software.

The Software is available for free at the link in the homepage of the website [www.daliform.com](http://www.daliform.com)

The screenshot shows the Daliform Group website homepage. At the top is the Daliform Group logo and navigation menu. The main content area features two columns. The left column is titled "Did you read the first technical textbook on the two-way voided slabs with of U-Boot® Beton system?" and describes a technical manual published by Dario Flaccovio. The right column is titled "U-Boot Beton® Design Software, the essential tool for structural analysis of plate design" and describes the online software. Both columns include a "SEND" button for requesting a copy or access. At the bottom of the right column, there are two red buttons labeled "ON LINE SOFTWARE" and "TUTORIAL".

## 2 Login

Multilanguage access.

- ① If you already have an account login with credentials activated by the confirmation email;
- ② Create an account by following the simple steps of the registration form;

The login form is titled 'Please sign in' and features the daliform GROUP logo at the top. It contains a language selection dropdown (currently showing 'English'), an 'Email address' input field, a 'Password' input field, a 'Forgot Password?' link, a prominent blue 'LOGIN' button, and a 'Not registered yet? Click here!' link at the bottom.

Figure 2 - Login.

## 3 User Interface

Quick and intuitive graphical interface

**3.1 Preliminary Input:** In the main window, the User can edit and insert, in a completely independent manner, the geometrical characteristics of the slab, the materials and the reference standards for the calculation of design resistant forces.

- ① Standards - EN 1992-1-1\_2005 or ACI-318-11;
- ② Materials - Concrete class and Steel grade reported to the standard;
- ③ Geometric characteristics input - by Free For or Simplified (Wizard) form;
- ④ Scrolling graph menu;
- ⑤ Characteristics Output;

The 3D model on the main screen automatically displays any change to the geometry of the configuration.

Individual changes to the height of the U-Boot formwork, the height of the feet (thickness of the lower slab therefore), can be easily conducted using the graphical "scrolling" menu on the left side of the screen.

**U-Boot Beton® SLAB characteristic OUTPUT**

|                                              |                         |        |
|----------------------------------------------|-------------------------|--------|
| Total height                                 | Ht (cm)                 | 28     |
| Voided slab inertia                          | cm <sup>4</sup> /m      | 158096 |
| Full concrete inertia with same thickness    | cm <sup>4</sup> /m      | 182933 |
| Equivalent full concrete slab thickness loss | %                       | 4.78   |
| Equivalent full concrete slab thickness      | cm                      | 26.7   |
| Voided slab concrete volume                  | m <sup>3</sup> /m       | 0.209  |
| U-Boot Beton® voided slab incidence          | %                       | 2.30   |
| Voided slab weight                           | G1 (kN/m <sup>2</sup> ) | 5.1    |
| Full concrete weight with same thickness     | G2 (kN/m <sup>2</sup> ) | 6.9    |
| Weight loss                                  | % P                     | 25     |
| Inertia loss                                 | % I                     | 14     |
| cross-section area loss                      | % A                     | 42     |

**FEM MODEL MODIFIER FOR SHELL WITH SAME THICKNESS**

|                                  |      |
|----------------------------------|------|
| inertia modifier i11, i22        | 0.86 |
| shear stiffness modifier t13,t23 | 0.58 |
| weight modifier                  | 0.75 |

Figure 3 - Preliminary Input.

On the right part of the screen, the table "Results" automatically updates the geometric and inertial characteristics of full and lightened section. It also shows the **modifiers** of inertia and weight to be considered in FEM modeling of the slab, according to the most common approach that provides for shell elements of the same slab thickness, both for the full concrete parts and for those lightened.

| Results                                          |                         |        |
|--------------------------------------------------|-------------------------|--------|
| U-Boot Beton® SLAB characteristic OUTPUT         |                         |        |
| Total height                                     | Ht (cm)                 | 28     |
| Voided slab inertia                              | cm <sup>4</sup> /m      | 158096 |
| Full concrete inertia with same thickness        | cm <sup>4</sup> /m      | 182933 |
| Equivalent full concrete slab thickness loss     |                         | 4.78 % |
| Equivalent full concrete slab thickness          |                         | 26.7   |
| Voided slab concrete volume                      |                         | 0.209  |
| U-Boot Beton® voided slab incidence              |                         | 2.30   |
| Voided slab weight                               | G1 (kN/m <sup>2</sup> ) | 5.1    |
| full concrete weight with same thickness         | G2 (kN/m <sup>2</sup> ) | 6.9    |
| Weight loss                                      | % P                     | 25 %   |
| inertia loss                                     | % I                     | 14 %   |
| cross-section area loss                          | % A                     | 42 %   |
| FEM MODEL MODIFIER FOR SHELL WITH SAME THICKNESS |                         |        |
| inertia modifier i11, i22                        |                         | 0.86   |
| shear stiffness modifier t13,t23                 |                         | 0.58   |
| weight modifier                                  |                         | 0.75   |

Geometric and inertial characteristics, full-section and lightened.

FEM Model modifier for shell with same thickness.

**Figure 4 - Geometric and inertial characteristics.**

Here below an example of implementation of the modifiers determined by the application, in a FEM Midas Gen model, having considered plate elements of the same thickness.

Figure 5 - Example of implementation of modifiers in a 3D-FEM model.

**3.2 Flexural Reinforcement:** In this section, it is possible to choose and enter the type of steel reinforcement as base or integrative reinforcement; the latter, distinguishing between integrations in the slab thickness or inside the ribs.

① Lower slab base reinforcement;

Concrete cover  $C_i$  [cm] from bottom side of slab.

② Upper slab base reinforcement;

Concrete cover  $C_s$  [cm] from top side of slab.

|                                      |   |                                         |                         |                                      |   |                                         |                         |
|--------------------------------------|---|-----------------------------------------|-------------------------|--------------------------------------|---|-----------------------------------------|-------------------------|
| Lower slab base reinforcement        | ① | <input type="text" value="Φ8-200X200"/> | 2.51 cm <sup>2</sup> /m | Upper slab base reinforcement        | ② | <input type="text" value="Φ6-200X200"/> | 1.41 cm <sup>2</sup> /m |
| Lower slab concrete cover $C_i$ (cm) |   | <input type="text" value="2.0"/>        |                         | Upper slab concrete cover $C_s$ (cm) |   | <input type="text" value="2.0"/>        |                         |

Base Reinforcement Input

Figure 6 - base reinforcement.

According to the geometrical characteristics, and the amount base reinforcement, the software calculates the section Resistant Moments -  $M_R$  [kNm/m] and [kNm].

| RESISTANT MOMENT CALCULATION            |                       |                                                                                |                  |             |        |                  |               |           |                            |                      |
|-----------------------------------------|-----------------------|--------------------------------------------------------------------------------|------------------|-------------|--------|------------------|---------------|-----------|----------------------------|----------------------|
| Type of integration                     | Nr. of Reinf. in Ribs | ULS with only base reinforcement / ULS with base and integrative reinforcement | Resistant moment |             |        |                  | Reinforcement |           |                            |                      |

Figure 9 - resistant moment calculation.

Where:

|                                      |                                                                                 |
|--------------------------------------|---------------------------------------------------------------------------------|
| Nr. of Reinf. in Ribs:               | Number of reinforcement in ribs                                                 |
| M <sub>R</sub> [kNm/m]:              | Resistant Moment per meter of width;                                            |
| M <sub>R</sub> [kNm]:                | Resistant Moment per a width equal to the rib's axis-to-axis distance;          |
| X [mm]:                              | Depth of neutral axis;                                                          |
| C [cm] from axis:                    | Position of the steel bar with respect to the lower or upper side respectively; |
| Φ [mm]:                              | Bars diameter;                                                                  |
| n°:                                  | Number of steel bars for each meter of width;                                   |
| A <sub>i</sub> [cm <sup>2</sup> /m]: | Steel reinforcement area for each meter of width;                               |
| Concrete Cover Check:                | OK-NO, the software checks for the presence of the minimum concrete cover.      |

In the case of **integrations in ribs**, it is necessary to enter the value of diameter first and subsequently the number of bars. The software will indicate the maximum allowable number of bars in relation to the width of the ribs.

**- Shear Reinforcement:** In this section, you can insert the shear reinforcement by modifying the rebar diameter and the spacing too. The software verifies that the minimum/maximum spacing of standard is always guaranteed.

- ① Shear reinforcement spacing;
- ② Shear reinforcement diameter;

The screenshot shows a software interface for defining shear reinforcement. It features two input fields: 'Shear reinforcement spacing' (labeled ①) with a dropdown menu set to 'S' and a value of '150' mm, and 'Shear reinforcement diameter' (labeled ②) with a dropdown menu set to 'Φ' and a value of '8' mm. Below these fields is a button labeled 'Shear Reinforcement'.

**Figure 10 - shear reinforcement.**

The software automatically returns the design shear resistance values of section with and without reinforcement.

| Shear resistance without reinforcement |                         |         |             |
|----------------------------------------|-------------------------|---------|-------------|
| K                                      | $k = 1 + [200/d]^{1/2}$ | 1.88    |             |
| V <sub>min</sub>                       | $v_{min}$               | 0.450   |             |
| Shear resistance without reinforcement | $V_{rd,c}$              | 16.38   | <b>kN</b>   |
|                                        | $V_{rd,c}$              | 24.82   | <b>kN/m</b> |
|                                        | $V_{rd,c}$              | 2530.99 | <b>Kg/m</b> |

**Figure 11 - shear resistance without reinforcement.**

| Compression strut angle                                                                    | $\phi$         | 21.80  | <b>deg</b>              |
| cotan of Compression strut angle                                                           | $\cotan(\phi)$ | 2.50   |                         |
| Shear reinforcement area single stirrup                                                    | $A_{sw}$       | 50.24  | <b>mm<sup>2</sup></b>   |
| Shear reinforcement total area                                                             | $SA'_{sw}$     | 50.24  | <b>mm<sup>2</sup></b>   |
| coefficient n1                                                                             | $v_1$          | 0.50   |                         |
| Design yield strenght of shear reinforcement                                               | $f_{cd}'$      | 7.08   | <b>N/mm<sup>2</sup></b> |
| Design value of the shear force which can be sustained by the yielding shear reinforcement | $V_{Rsd}$      | 76.70  | <b>kN</b>               |
| Design shear reinforcement of the member without shear reinforcement                       | $V_{Rcd}$      | 80.04  | <b>kN</b>               |
| Design shear resistance                                                                    | $V_{Rd}$       | 76.70  | <b>kN</b>               |
|                                                                                            | $v_{rd,s}$     | 116.20 | <b>kN/m</b>             |
|                                                                                            | $v_{rd,s}$     | 11850  | <b>Kg/m</b>             |

**Figure 12 - shear resistance with reinforcement.**

**- Design Forces:** In this section the user can enter the design forces values determined with the help of any 3D-FEM software; the application will compare them with the corresponding resistant values that will have previously been calculated based on the user-set geometry.

Design moment  $M^*_{sd,11}$   kNm/m    Design moment  $M^*_{sd,11}$   kNm/m    Design shear  $V_{sd}$   kNm  
 Design moment  $M^*_{sd,22}$   kNm/m    Design moment  $M^*_{sd,22}$   kNm/m   

Figure 13 - Design forces.

Enter the design forces, press “calculate”, and check:

| CHECK:                         |    |                                |    |
|--------------------------------|----|--------------------------------|----|
| $M^*_{sd,11} \leq M^*_{rd,11}$ | OK | $M^*_{sd,11} \leq M^*_{rd,11}$ | OK |
| $M^*_{sd,22} \leq M^*_{rd,22}$ | OK | $M^*_{sd,22} \leq M^*_{rd,22}$ | OK |
| $V_{sd} \leq V_{rd}$           | OK |                                |    |

Figure 14 - Design forces Check.

**- Report Preview:**

In section, "Report Preview" the user has several useful tools available:

Download of the complete calculation report.

Download the Technical prescription and instruction for use of U-Boot system.

Download the technical sheet of the U-Boot element selected by the user in the single project.

Download of detailed cad sections in .DXF format.

Download of detailed cad model of U-Boot in .FBX format.

**- View:** In the main window of the application, there is always the 3D model of the slab that the user is realizing. The template is automatically updated to any change (geometry, steel reinforcement, etc.) that the user makes. In the "view" section, there are several utilities.

- ① Let you view or not each order of steel reinforcement (base, integrations, shear);
- ② They return the model to pre-set positions;
  - \* Use the left button of mouse to rotate the model.
  - \* Use the right button of mouse to move (pan) the model.
  - \* Use the scroll of mouse to zoom in or out the model.
- ③ Viewing options;
  - \* Show or hide the concrete;
  - \* Set the transparency of concrete;
  - \* Show or hide the dimension;

Figure 15 - View section.

All **dimensions** in the model, except the fixed ones (in grey), can be used to modify the corresponding geometrical parameter of the slab, as shown in the figure below.

Figure 16 - Edit model by dimensions.

Figure 17 - Edit U-Boot Beton® height by dimensions.
